# Heterogeneity of the Informal Sector in Vietnam: A Quali-Quanti Approach

**LE Thi Thuy Linh**

IRD-DIAL

*July 25, 2014*

# Context and motivation

- Prevalence of the informal sector in Vietnam:
  - 2007: 50% non-farm jobs and 20% GDP (Cling et al., 2010).
- Too little attention from the State.
- Knowledge in the informal sector in Vietnam is quite limited.

# Research Question

- Is the informal sector in Vietnam homogeneous or heterogeneous, and how heterogeneous is it?

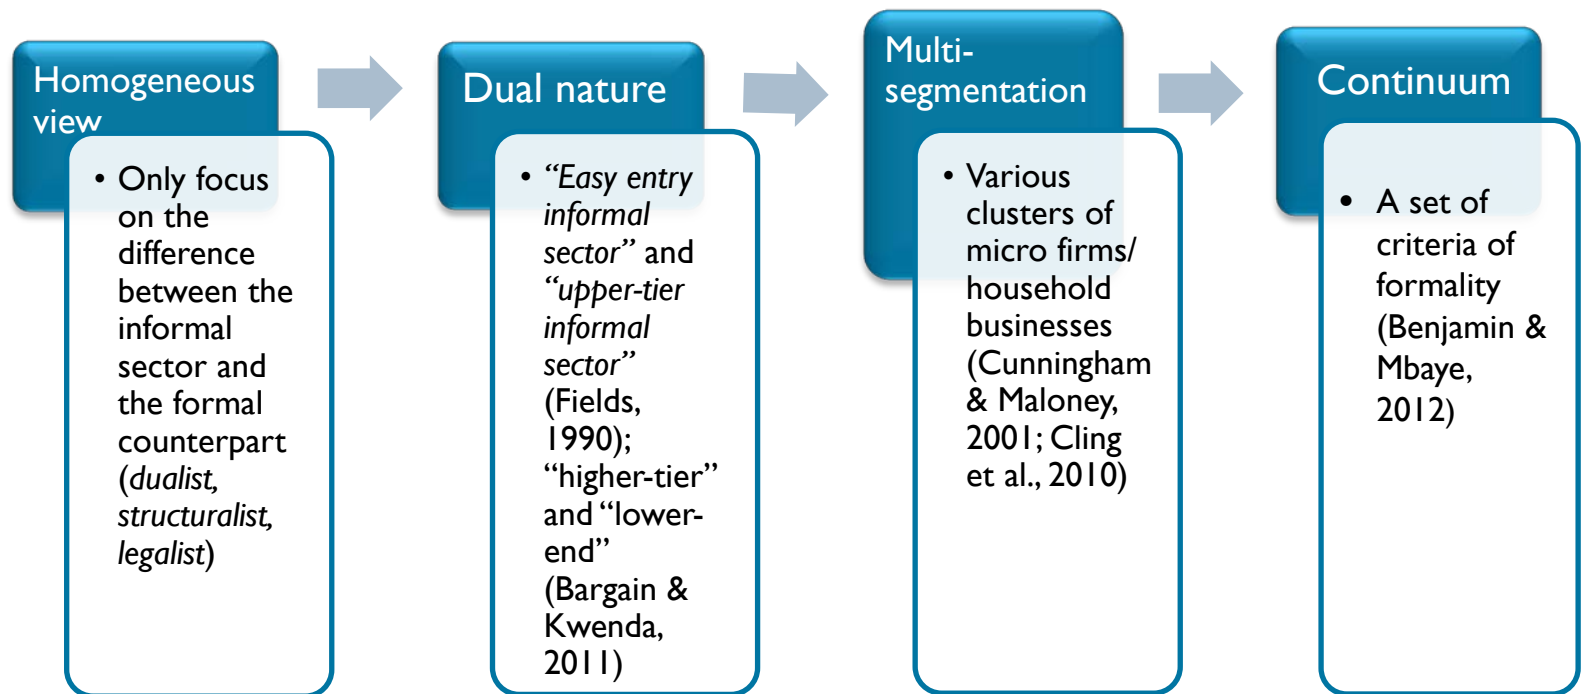

# Outline

- 1) Literature review
- 2) Data
- 3) Methodology
- 4) Key findings
- 5) Policy implication

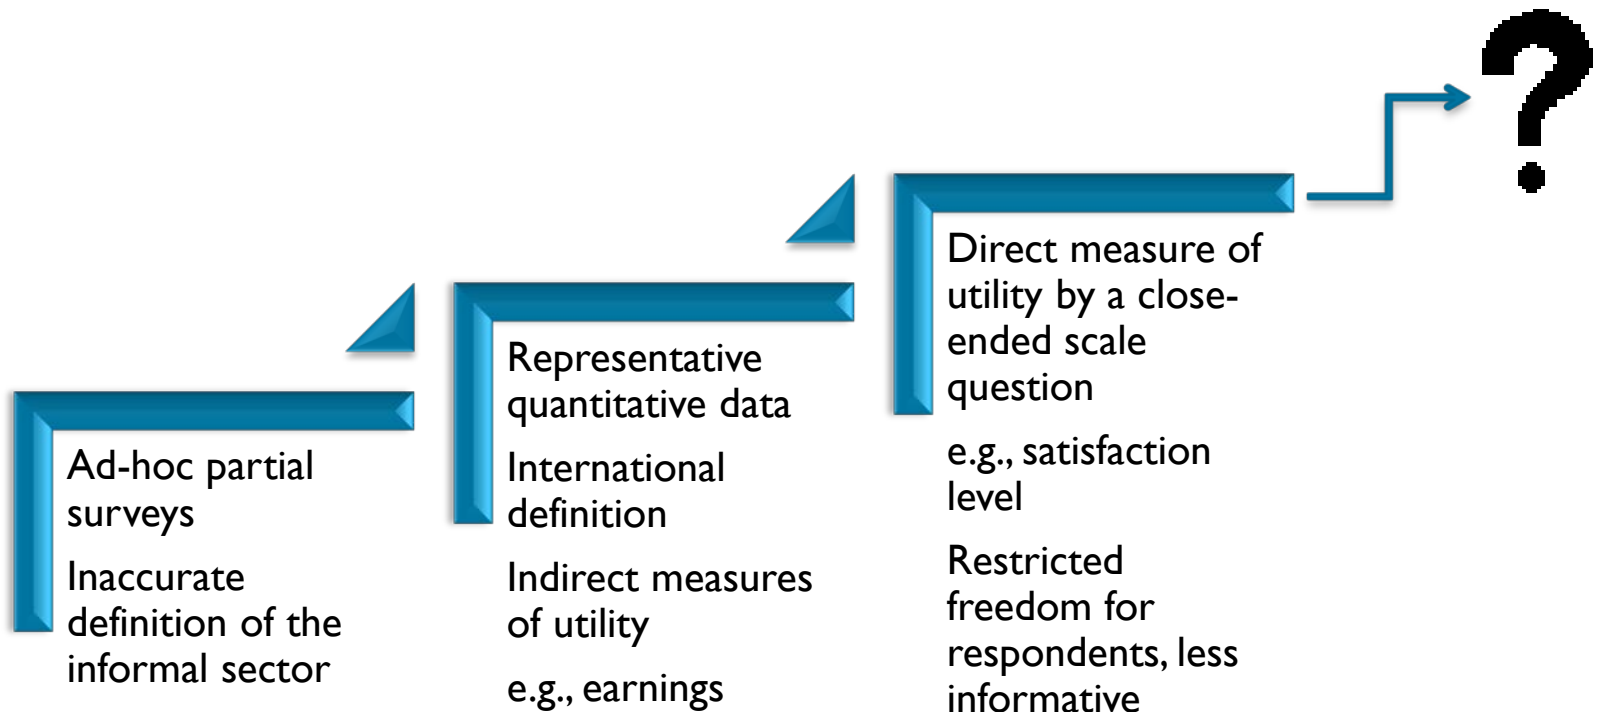

# I. Literature review

- Heterogeneity of the informal sector is widely acknowledged, but at different levels.

# Filling research gap

- What existing literature has done:

# Filling research gap (cont.)

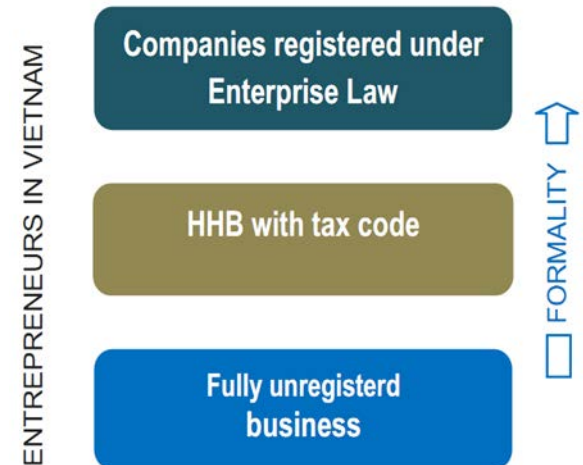

- What this research contribute:
  - Representative **textual** data = direct measure of utility of HBs in a non-restricted manner.
  - **Exploratory** analytical methods (i.e., correspondence and cluster analysis) limit the pre-conceived ideas of researchers.
  - The very first economic paper that solves the **linguistic** difficulties associated with Vietnamese texts.

## 2. Data

- Household Businesses and Informal Sector Survey, Ho Chi Minh City 2009: **representative** quantitative and qualitative data.
- Informal sector = all private unincorporated enterprises that:
  - produce at least some of their goods and services for sale or barter
  - are not registered (i.e., having no business license)
  - are engaged in non-agricultural activities

NB: “unincorporated enterprises” = household business (HB)

- Sample size = 1023 HBs

Source: *Economica Vietnam* (2013)

## 2. Data (cont.)

- **Qualitative data**: three open-ended questions were added into an informal sector survey for the very first time.
  - *“Please state any advantages while running a business like yours.”*
  - *“Please state any disadvantages while running a business like yours.”*
  - *“State any subjects related to your business that have not been mentioned or clarified before.”*

# 3. Methodology

- Textual data = multi-dimensional and structure is unknown.

→ Exploratory analyses

Correspondence  
Analysis

- A multivariate statistical technique to extract the most important and uncorrelated dimensions from large data.

Cluster Analysis

- Division of data into groups of similar objects.

# How to apply on texts ?

- Lexical “*contingency table*”:
  - columns = distinct words used
  - rows = HBs (individual observations)
- Vietnamese words – a challenge:
  - Special letters: ê, ă, â, ô, ơ, ư
  - Tone marks: “level,” “hanging,” “sharp,” “asking,” “tumbling,” and “heavy.”
  - **Word boundary** : words are often formed by two or more separated syllables, which can only be recognized by context.

# New coding method

- Letters:

ă = aw; â = aa; đ = dd; ê = ee; ô = oo; ơ = ow; ư = w

- Tone marks

` (“hanging”) = f

´ (“sharp”) = s

˘ (“asking”) = r

~ (“tumbling”) = x

. (“heavy”) = j

- Word boundary

“cạnh tranh” = canhjtranh (competition)

“nguyên vật liệu” = nguyeenvaatjlieeuj (materials)

## 4. Key findings

- 1) The informal sector is heterogeneous and can be considered as a **continuum** of HBs.
- 2) Generally low satisfaction of working in the informal sector.

## 4.1. Descriptive statistics

**Table 2: Summary of Step Numerical Coding of Texts**

	Disadvantages	Advantages
<b>Total number of responses</b>	505	433
<b>Total number of words</b>	5188	3498
<b>Number of distinct words</b>	867	585

Source: HB&IS HCMC (2009); authors' calculations.

→ Low satisfaction of working in the informal sector.

## 4.1. Descriptive statistics (cont.)

**Table 4: Most Frequent Words Used by Informal HBs**

Disadvantages	Frequency	Advantages	Frequency
Customers	102	Home	78
Prices	79	Customers	67
Capital	56	Stable	57
Location	35	Premise	54
Competition	32	Location	50

Source: HB&IS HCMC (2009); authors' calculations.

## 4.1. Descriptive statistics (cont.)

**Table 5: The Main Difficulties Faced by Informal HBs**

The most difficulty faced	Frequency	Percentage
Competition	119	30.75
Lack of customers	57	14.73
Access to loan	55	14.21
Premise, space	49	12.66
Cash flow	25	6.46
Machine, equipment	21	5.43
Material supply	18	4.65
Crime, theft, disorder	13	3.36
Inflation, exchange rate	11	2.84
Transportation	9	2.33
Other	7	1.81
Access to land	3	0.78

Source: HB&IS HCMC (2009); authors' calculations.

→ Question design can greatly affect data outcome.

## 4.2. Correspondence Analysis

**Table 6: The First Five Factors of CA**

Factor	Advantages		Disadvantages	
	Eigenvalue	Percentage	Eigenvalue	Percentage
1	0.5848	<b>1.96</b>	0.5114	<b>1.39</b>
2	0.5597	<b>1.88</b>	0.4925	<b>1.34</b>
3	0.5311	1.78	0.4878	1.32
4	0.5093	1.71	0.4578	1.24
5	0.494	1.66	0.4537	1.23

Source: HB&IS HCMC (2009); authors' calculations.

## 4.2. Correspondence Analysis

# Disadvantages

**Table 8: Selective Points with Extreme Contributions on the First Two Principal Axes**

## 5. Conclusion

# Policy implication

- A “*one size fits all*” scheme would not be appropriate for this highly heterogeneous informal sector.
- A policy package could include:
  - Anti-poverty policies for lower-end HBs and professional policies on business environment for higher-end HBs.
  - Premise stabilization for “*precarious HBs*,” vocational training for “*desolate HBs*,” inflation control for “*optimistic HBs*.”

## 5. Conclusion (cont.)

- Value-added of this research work:
  - New finding: Continuum of HBs in Vietnam.
  - New approach:
    - Textual data
    - Exploratory analysis
    - Vietnamese language treatment
- Avenue for future research:
  - Sensitivity tests
  - Dynamics of the informal sector
  - Employ HBs' coordinates on the factors as continuous variables in econometric models
  - Development of statistical packages that systematically handle Vietnamese texts.

*Thank you  
for your attention !*

# Q & A
